

HEALD®

SPARTA 80 CRASH TESTED BOLLARD

Heald's HT1-Sparta fixed bollard series offer simple, affordable PAS68 security suitable for a range of sites. It is available with stylish stainless steel covers to aid integration with modern architecture, and in two security levels depending on application.

The Sparta 80 has a classification of PAS68:7500 (N3) 80/90:10.6/11.1; this means it will halt a 7.5 tonne truck travelling at 80 kph. As the Sparta bollard was tested as an individual unit, it is extremely flexible in use. A Sparta bollard can be used on its own to secure a narrow opening, or as part of an array to protect an area of virtually unlimited size. A Sparta array can be arranged around a corner, in an arc or even on a slope where required.

Installation and Integration

The Sparta 80 requires an excavation depth of 875 mm. Although this is deeper than our shallow mount bollard ranges such as the HT1-Fixed Matador and HT1-Mantis, it still offers a much shallower option than most other bollards on the market. The Sparta range, like all Heald products is extremely quick and efficient to install. Installation details available by request.

The Sparta range is ideal for high security installations where modern design and integration are essential. Its stainless steel covers exude a timeless modern style and it can be finished to match Heald's Crash Tested Rising Bollards or HT1-Matador sliding bollard.

HEALD®
